

DATA SHEET

EXABEAM CLOUD PLATFORM

Today, a modern security incident and event management (SIEM) solution is composed of a data lake, user and entity behavioral analytics (UEBA), and security orchestration and response (SOAR). Modern SIEMs, like the Exabeam Security Management Platform (SMP), significantly improve organizations' ability to detect, investigate and respond to attacker tactics, techniques and behaviors (TTPs). However, while these solutions are significant improvements to legacy SIEMs, security teams continue to look for additional capabilities to keep pace with attackers.

Security leaders continue to update multi-year plans that outline how they will further mature their security operations. To do so, they look to quickly deploy new applications to protect users, IT and OT devices, and the cloud. In an ideal world, they seek to augment existing capabilities without having to vet new vendors and engage in the related tasks of security audits, infrastructure sizing etc.

To tailor those solutions to their unique needs and to cover new security use cases, they look to easily add new and custom content like parsers, detection rules

and models, and incident response actions. In parallel, they seek to improve the operational efficiency of their security and inside threat teams. Specifically, they want to reduce engineering effort to deploy and maintain new solutions and allow analysts to complete tasks faster.

EXABEAM CLOUD PLATFORM

The Exabeam Cloud Platform is designed to meet the current and future needs of security teams by extending the capabilities of the Exabeam SMP.

IMPROVE SECURITY MATURITY

The Cloud Platform, a security platform-as-a-service (PaaS), helps security leaders continuously improve their security posture by expediting the provisioning and consumption of new security management applications, tools and content.

DEPLOY NEW SECURITY USE CASES

Architects can quickly implement new use cases by deploying services based on capabilities unique to Exabeam including a unique UEBA solution, object centric workspaces, cloud storage, and data graphing.

IMPROVE OPERATIONAL EFFICIENCY

Productivity is improved as many engineering tasks needed to deploy and maintain the infrastructure underlying services are eliminated, while automation and analytics allow analysts to work faster.

EXABEAM CLOUD PLATFORM

The Cloud Platform allows security teams to readily access applications, tools and content.

APPLICATION MARKETPLACE

The Application Marketplace provides security teams with a single online location to try, buy and deploy Exabeam security management applications. Available applications include:

- **The Exabeam Cloud Archive** – allows Exabeam SaaS Cloud customers to establish a second, cheaper storage tier for the long-term retention of security without having to endure long search times or inaccessible storage.
- **The Exabeam Threat Intelligence Service (TIS)** – allows security teams to fully integrate threat intelligence with correlation rules or behavioral analysis models to indicate added risk of notable users and entities. TIS is available to Exabeam customers at no additional cost.

In the future, applications will also be available from trusted partners. Partners will be able to build applications on the Cloud Platform using Exabeam's software development toolkit (SDK) or simply sell them through the marketplace.

CLOUD STUDIO

The Cloud Studio is a toolbox of free tools for engineers to use to quickly develop the content they need to support new use cases. Available tools include:

- **The Exabeam Parser Editor** – allows customers to build parsers that are not available out-of-the-box by uploading a log file and using the simple, intuitive UI of a self-service wizard.

REAL-TIME CONTENT UPDATES

Real-time content updates will allow engineers to access new parsers, rules and models, dashboards and certain Exabeam product fixes to extend or deploy new use cases.

- **Exabeam Content Packs** are currently available for download in the Exabeam online community.
